

## Imagine ... working with an ASC chemist

Being advised by a scientist (not a chemical salesman) provides a comprehensive, science-based program for \$192 / system / year.

In this environment:

- zone valves do not seize
- boiler tubes do not corrode or pit
- all treatment chemicals are supplied within the program
- system histories are accessible from any computer
- closed loops may be treated with a single portable feeder
- glycol feed tanks are always clean and fresh
- corrosion monitors are installed easily on system faucets
- system volumes are measured with a dye test
- steam boilers and all of the systems they serve are protected
- circulating *Kevlar* fibers plug underground leaks before they are noticed
- spent treatment can be removed from glycol systems with no loss of antifreeze

### Test Drive our Program.

Here is a free postage-paid mailer containing 10 sample bottles and labels.

Sample any 10 systems of your choice and mail the kit to our laboratory. After analyzing the samples, we'll send you a color report with recommendations.

Please enclose your [business card](#) or [letterhead](#).

As a team, we can cooperate with your maintenance staff and protect your closed systems so they last as long as the buildings they serve.
